Exp 3 – Survey Report on Emerging Trends in Low-Code Development

Aim

To study the new trends in low-code app development and understand how they affect modern software, with focus on banking apps.

Theory

Low-code lets users build apps with visual tools and very little code. Banks use it to build internal tools fast, such as account opening, loan tracking, and customer service apps. The main trends are:

- **AI integration:** AI suggests code, builds forms from a prompt, and predicts things like loan default risk.
- **Citizen development:** Branch staff with little coding knowledge can build simple tools.
- **Cloud-native apps:** Apps run on the cloud, so branches can use them from anywhere.
- **Business process automation:** Approvals, EMI reminders, and KYC checks run on their own.
- **Cross-platform apps:** Build once and use on web and mobile.
- **API integration:** Connect with payment gateways, SMS services, and credit bureaus.
- **Security and governance:** Role-based access, encryption, and audit logs help meet banking rules.
- **DevOps and CI/CD:** Faster testing and safe updates using separate environments.

Procedure

1. Study the idea of low-code app development.
2. Identify popular low-code platforms and their key features.
3. Collect information on new trends from research papers, industry reports, and official documents.
4. Analyze trends such as AI, citizen development, cloud, automation, APIs, and security.
5. Compare the benefits and challenges of each trend for a banking app.
6. Record the observations and summarize the findings.

7. Prepare the survey report.

Result

The survey showed that low-code is growing fast with AI-assisted building, cloud apps, citizen development, automation, API integration, and better security. These trends help banks build apps faster and at lower cost, while supporting digital transformation.
